Claim 2; Page 21-22; 34pp; English. This sequence represents the endoflagellum sheath protein of T. This sequence represents the endoflagellum consists of at least four proteins, this protien forms the sheath of the flagellum and three proteins, of molecular weights 37, 34 and 32 kD, make up its core. Antibodies raised against the sheath protein have been shown to be bacteriacidal for T. hyodysenteriae. The 43 kD sheath protein can be used in the production of a vaccine against infections such as swine dysentery.  Sequence 320 AA;	Treponema hyodysenteriae.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 subspecies pallidum is encoded by a 765 bp sequence (TROMP2 gene). This is a precursor TROMP2 protein of 242 amino acids. Treponemes were extracted from infected rabbit testicles and the suspension was subjected to two low speed centrifugations to remove the tissue debris. Treponemes were obtained from the uppermost zone gradient after two high speed centrifugations involving a density gradient separation medium. R18 octyl-decyl Rhodamine chloride was added to the treponemal suspension which was incubated at room temperature for the injuries and then centrifuged. The treponemal pellet was resuspended to minutes and then centrifuged. The treponemal pellet was resuspended
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated Treponema pallidum outer membrane protein - used in detection and induction of immune response in an animal to pathogenic Spirochaetales Claim 1; Fig 11; 77pp; English.

This rare outer membrane protein (OMP) of species Treponema pallishers rare outer membrane protein (OMP) of species (TROMP2 gene) subspecies pallidum is encoded by a 765 bp sequence (TROMP2 gene)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (SLOK ) SLOAN KETTERING INST CANCER RES.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                   in ice cold sodium citrate buffer, incubated with occasional vortexing to release the outer membrane from the inner membrane Treponemal protoplasmic cylinders were removed by centrifugation. The outer membrane in the supernatant was subjected to SDS-PAGE to obtain the rare OMP. The recombinant expression of the rare OMP can be used for diagnostic tests to detect syphilis and for development of host immunity during syphilis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              W22133 standard; Protein; W22133;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Example 1; Page 13-20; 56pp; English.

This sequence represents the ApXIV toxin serotype 1 isolated from Actinobacillus pleuropneumoniae strain 4074 (serotype 1 reference strain). The invention relates to an attenuated live Actinobacillus pleuropneumoniae microorganism producing no functional ApXIV toxin. The invention also provides a subunit vaccine for protecting an animal envention also provides a subunit vaccine for protecting an animal apainst infection of A. pleuropneumoniae, the vaccine contains pure ApXIV toxin and a pharmacologically allowable carrier. The pure ApXIV toxin and a pharmacologically allowable carrier of an antibody against apXIV for distinguishing A. pleuropneumoniae infection from A. suis.

N.B. This sequence was indexed from EP-875574, which is the first major country equivalent to JP10290695.

The invention relates to an attenuated live Actinobacillus pleuropneumoniae microorganism producing no functional ApxIV toxin. The invention also provides a subunit vaccine for protecting an animal against infection of A. pleuropneumoniae, the vaccine contains pure ApxIV toxin and a pharmacologically allowable carrier. The pure ApxIV toxin can be used for the diagnosis based on the presence of an antibody against ApxIV for distinguishing A. pleuropneumoniae infection from A. suis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The Bacillus subtilis chromosomal DNA region comprises the srfA operon which encodes the multienzyme complex surfactin synthetase (MCSS). Analysis of the sequence showed four regions potentially coding for proteins, a zone upstream of the first ORF contg. the srfA operon promoter and a presumed terminator positioned downstream of the stop codon of the fourth ORF. Chromosomal DNA downstream of the ORF4 stop codon was also sequenced, sharing four regions (ORF5-8) potentially coding for different prods. ORF6 and ORF7 are contiguous and are potentially transcribed in the opposite direction to srfA from a single promoter situated between ORF7 and ORF8. ORF8 is
N-PSDB; V68343.

Transcriptional regulator gene containing bromodomain sequence be expressed in testis tissue and is useful in treatment of car

Claim 1; Page 19-24; 42pp; Japanese.
The present sequence represents the human transcriptional regulatory factor RING3, which is isolated from testicular cells. RING3 contains a testis specific bromodomain (TSB) which is expressed specifically in testis tissue and also expressed in certain tumour lines. The transgenic cells may be used to express RING3 which is a TSB expression protein. The TSB expression product can be used in the treatment of cancer and other proliferative disorders, and in screening of compounds for ability to bind to it (e.g. for use as drugs by modulation of transcriptional regulation). DNA capable of hybridising to RING3 polynucleotides may be used for construction of probes and primers.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                isolated using sera from cancer patients, used to develop products for the diagnosis, monitoring or treatment of cancers Disclosure; Page 728-730; 787pp; English.

The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by a nucleic acid molecule (NAM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions
                                                                                                                                                                                  peptic ulcer disease
Helicobacter pylori.

This sequence represents a Helicobacter pylori GHPO protein of the invention. The polypeptides can be used for preventing or treating Helicobacter infections, and gastroduodenal diseases associated with these infections, including acute, chronic, and atrophic gastritis, and peptic ulcer diseases, e.g. gastric and duodenal ulcers. They can also be used for the production of antibodies. The products can also be used for detection and diagnosis.
                                                                                                   Putative protective antigens against Mycoplasma detection, prevention or treatment of Mycoplasma hyopneumoniae in swine Disclosure: Fig 7: 43pp: English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     misc_difference
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Mycoplasma 46-48 kDa protective antigen. Antigen; vaccine; mycoplasmal pneumonia;
Ayopheumwater and the projective antigen Disclosure; Fig 7; 43pp; English.

The gene (T38241) coding for a 48 kDa putative protective antigen The gene (T38241) coding for a 48 kDa putative protective antigen The gene (T38241) coding for a 48 kDa putative protective antigen (W01037) was obtd. from a Mycoplasma hyopneumoniae genomic librar (W01037) was obtd. from a Mycoplasma hyopneumoniae genomic librar (W01037) was obtd. from a Mycoplasma hyopneumoniae genomic librar (W01037) was obtd. from a Mycoplasma hyopneumoniae genomic librar (W01037) was obtd. from a Mycoplasma hyopneumoniae genomic librar (W01037) was obtd. from a Mycoplasma hyopneumoniae genomic librar (W01037) was obtd. from a Mycoplasma hyopneumoniae genomic librar (W01037) was obtd. from a Mycoplasma hyopneumoniae genomic librar (W01037) was obtd. from a Mycoplasma hyopneumoniae genomic librar (W01037) was obtd. from a Mycoplasma hyopneumoniae genomic librar (W01037) was obtd. from a Mycoplasma hyopneumoniae genomic librar (W01037) was obtd. from a Mycoplasma hyopneumoniae genomic librar (W01037) was obtd. from a Mycoplasma hyopneumoniae genomic librar (W01037) was obtd. from a Mycoplasma hyopneumoniae genomic librar (W01037) was obtd. from a Mycoplasma hyopneumoniae genomic librar (W01037) was obtd.

The antigen had originally been isolated from M. hyponeumoniae cells using antibody probes enriched with Mycopl specific antibodies. Other protective antigens were also iden (see also W01024-31). Protective antigens and antibodies can used in vaccines for preventing or treating mycoplasmal infect partic. M. hypneumoniae infections in swine. They can also b for diagnosis.
New DNA sequence encoding canine zona pellucida CZP2 - useful for the prodn. of a canine contraceptive vaccine antigen claim 1; Page 8-10; 10pp; Japanese.

The CZP2 DNA (Q70072) was prepd. by the cloning of CZP2(75-520) - Q81700 using the primers given in Q70073-74, CZP2(1-65) - Q81804 using the primers given in Q70082-83, CZP2(42-103) - Q81803 using the primers given in Q70079-81 and CZP2(487-713) - Q81957 using the primers given in Q70075-78.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁
                                 HGE-25. This polypeptide is useful in the treatment of Ehrlichia infection, and as a vaccine for the prevention of infection. Such vaccines comprise an immunogenic portion of an Ehrlichia antigen associated with human granulocytic ehrlichiosis (or a variant) and is thus especially useful in the treatment of human granulocytic ehrlichiosis (HGE). The polypeptides, antigenic epitopes or DNA molecules can be combined with a suitable carrier in pharmaceutical compositions. Such compositions and vaccines are useful to manufacture medicaments for inducing protective immunity against Ehrlichia infection in patients especially against HGE. HGE is caused by a rodent bacterium normally transmitted to humans by the same tick which transmits Lyme disease and babesiosis. Co-infection with these diseases is thus possible and the compositions of the invention may be used in methods to detect at least one of Ehrlichia infection, Lyme disease or B. microti infection in
                                                                                                                                                                                                                                                                                            Example 1; Page 125-127; 140pp; English. This sequence represents an immunogenic HGE-25. This polypeptide is useful in thinfection, and as a vaccine for the previous
                                                                                                                                                                                                                                                                                                                                                                                                       Poly:peptide(s) comprising immunogenic portion of Ehrlichia antigen and encoding DNA sequences, useful for e.g. diagnosis and treatment of Ehrlichia infection, especially human granulocytic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    23-MAR-1998; U05695.

                               associated with human granulocytic ehrlichiosis (or a variant) and is thus especially useful in the treatment of human granulocytic ehrlichiosis (HGE). The polypeptides, antigenic epitopes or DNA molecules can be combined with a suitable carrier in pharmaceutical compositions. Such compositions and vaccines are useful to manufacture medicaments for inducing protective immunity against Ehrlichia infection in patients especially against HGE. HGE is caused by a rodent bacterium normally transmitted to humans by the same tick which transmits Lyme disease and babesiosis. Co-infection with these diseases is thus possible and the compositions of the invention may be used in methods to detect at least one of Ehrlichia infection, Lyme disease or B. microti infection in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            LIMAR-1999 (first entry)

This sequence represents the granulocytic ehrlichia (GE) protein W20. which has been isolated from HL60 cells infected with Ehrlichia sp. G is an acute potentially fatal tick borne infection and the proteins is an acute potentially fatal tick borne infection and exercised in this invention can be used in vaccines to elicit a beneficial immune response in an animal to GE. They can be used for inhibiting Ehrlichoisis in an animal. The products can also be used for

                                                            DNA and peptide of mycoplasma hyopneumoniae - useful for diagnosts and treatment of swine mycoplasmal pneumonia plasmats and treatment of swine mycoplasmal pneumonia plasmats and primers used in a method of diagnosing mycoplasmal pneumonia of swine.

Wycoplasmal cells were collected from the culture of M.hp, lysed in a mycoplasmal pneumonia of swine.

Wycoplasmal cells were collected from the culture of M.hp, lysed in a culfer containing SDS, followed by the extraction of DNA and cells containing SDS, followed by the extraction of DNA and cells contained by the extraction of DNA and cells and the resulting fragment is inserted into a plasmid contained by the strength of the site cleaved with HindIII. This plasmid is transformed into E. coli as a host cell, colony hybridization is performed by the DNA probe method utilizing EcoRI fragments of pKUM1 and pKUM2 to select the bacterial cells containing a plasmid (pURR126) carrying the CG antigenic gene. E. coli JM 109 which comprises the plasmid CC pKUM1 or pKUM2 is deposited with FRI under accession No. FERM P-10318 CC 027A1319. The base sequence of the 46 kd antigen gene is given in

DPAP acts synergistically with aminopeptidase (AP) to hydrolyse polypeptides, producing protein hydrolysate (PH), useful in foods as flavour enhancer, e.g. in baked goods, enriched in: (a) Ala, Arg, Asp, Gly and/or Val, or (b), if the substrate has been deamidated, in Glu (free and/or peptide bound), in which case products are useful as animal feed additives. DPAP can also be used in flavour-improving compositions (optionally containing AP) and in dough pre-mixes, also for deactivating enzymes and for converting precursors to mature proteins. DPAP increases the level of hydrolysis of proteins and thus of flavour development, and a mixture with AP may hydrolyse tripeptides that are resistant to either enzyme used alone. PH have improved solubility, emulsifying and foaming properties, and products containing them have better flavour, palatability, mouthfeel, aroma and crust
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       20-OCT-1997; US-062892.

New dipeptidyl aminopeptidase from Aspergillus oryzae - used to
produce protein hydrolysates enriched in particular amino acids,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       17-MAR-1999 (first entry)
Saccharomyces cerevisiae dipeptidyl aminopeptidase I.
Saccharomyces cerevisiae dipeptidase; protein hydrolysate; dough;
Prolyl dipeptidyl aminopeptidase; protein hydrolysate; dough;
flavour enhancer; palatability; mouthfeel; aroma; crust colour;
baking; animal feed additive; hydrolysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      useful as flavour enhancers, e.g. in doughs Example 7; Page 59-61; 77pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                W89596 standard; Protein; 931 AA. Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

"The periplasmic flagella of Sepulina (Treponema) hyodysenteriae
composed of two sheath proteins and three core proteins.";
J. GEN. MICROBIOL. 138:2697-2706(1992).
1- FUNCTION: COMPONENT OF THE OUTER LAYER OF THE FLAGELLA.
-!- SUBUNIT: OUTER LAYER IS COMPOSED OF TWO SHEATH PROTEINS, FLAA1
(44 KD) AND FLAA2 (35 KD) AND A CORE THAT CONTAINS THREE PROTE
FLAB1 (37 KD), FLAB2 (34 KD) AND FLAB3 (32 KD).
                                                                                                                                                                                                                                                                            SEQUENCE C
STRAIN-C5;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        TREPONEMA HYODYSENTERIAE BACTERIA; SPIROCHAETALES;
